Properties of Waves

This section describes the basic properties of waves. It also explains how a wave’s speed is related to its wavelength and frequency.

Use Target Reading Skills

As you read about the properties of waves, make an outline using the red headings for the main ideas and the blue headings for the supporting ideas.

Introduction

1. What are four basic properties of waves?

Amplitude

2. The maximum distance the particles of the medium carrying a wave move away from their rest position is called the wave’s _________________________.

3. Explain what the amplitude of a water wave is.
Characteristics of Waves · Guided Reading and Study

4. The amplitude of a wave is a direct measure of its_____________________.

5. What is the amplitude of a longitudinal wave?

___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________

6. Circle the letter of each phrase that correctly defines the amplitude of a transverse wave.
   a. The distance from the bottom of a trough to the top of a crest
   b. The maximum distance the particles of the medium move up or down from their rest position
   c. The maximum distance from one point on the rest position to another point on the rest position
   d. The distance from the rest position to a crest or to a trough

7. Suppose a longitudinal wave has crowded compressions and loose rarefactions. Does it have a large or a small amplitude?

___________________________________________________________________________

Wavelength

8. The distance between two corresponding parts of a wave is its_____________________.

9. How can you find the wavelength of a transverse wave?

___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________

10. How can you find the wavelength of a longitudinal wave?

___________________________________________________________________________
___________________________________________________________________________
___________________________________________________________________________

**Frequency**

11. The number of complete waves that pass a given point in a certain amount of time is called the wave’s _______________________.

12. If you make a wave in a rope so that one wave passes every second, what is its frequency?

___________________________________________________________________________

13. Circle the letter of the unit used to measure frequency.
   a. watt
   b. seconds
   c. joule
   d. hertz

**Speed**

14. The speed of a wave is how far the wave travels in one unit of _______________________.

Complete the following formulas.

15. Speed = ___________________________________________________________________

16. Frequency = __________________________________________________________________

17. Wavelength = __________________________________________________________________

18. Circle the letter of each sentence that is true about the speed of waves.
   a. Speed increases as a wavelength increases.
   b. In a given medium and under the same conditions, the speed of a wave is constant.
   c. If the temperature and pressure of air change, the speed of sound waves traveling through the air will change.
   d. The same wave may travel at different speeds in different mediums.

19. If you increase the frequency of a wave, the wavelength must

__________________________.
